Instructions

Requirement:

1. Python 2.7 (https://www.python.org/downloads/)

2. PIP to install the following packages in Python

   (https://pip.pypa.io/en/stable/installing/)

3. Python Requests, to make requests and download the HTML content of the pages

   (http://docs.python-requests.org/en/master/user/install/).

weather.py file and IMPORT.py file:

Data form from weather.py file is get from

http://samples.openweathermap.org/data/2.5/weather?q=London,uk&appid=b1b15e88fa7
97225412429c1c50c122a1

However, this is a sample. You need to create an account on OPENWEATERHMAP

website and get an API KEYS. Then you can get a result, which is a list of dictionaries.

Since it returns with unicode and TKinter do not support the unicode, I have converted to

ASCII on IMPORT.py file.

Codes citation:

API file for hotels from this website: https://www.scrapehero.com/how-to-scrape-
tripadvisor/

I write some codes to get the hotel names.
